Collected Knowledge & Wisdom on

GNews

Provides:

The Unofficial Google News API is used for collecting articles corresponding to a given set of keywords. The API was created as an alternative to Google's closure of their Google News API. It allows you to receive up to 100 articles per search (on the free plan). Each article contains a title, a description, the article link, the website, the source and the date.

Key Provisioning: **Pain factor** (*0=ezpz...5=nightmare*): **2**

- Create an account at GNews.io, and under the free plan you will be given a key after logging in.
- Authentication is handled by your key. You must pass your key as a GET parameter. https://gnews.io/api/v3/{endpoint}?token=[Key]

Quotas:

- 100 searches per day

The Good:

- Documentation is pretty convenient and clear: https://gnews.io/docs/v3?javascript#introduction

The Bad:

- Requires the use of JS, can't easily be implemented with python.

The Ugly:

- Tables of country, language, topic codes, etc are found in the docs and there is no way to customize result parameters except by using gnews proprietary standards for specifying international codes.

Location: https://gnews.io/api/v3/search?q=example&token=API-Token
- Example and q are placeholders for parameters
- API-token is the key
